Developing Back-End Apps with Node.js and Express Module 3 Cheat Sheet: Express Web Application Framework

Package/Method	Description	Code Example
	A dependency of	1. 1
Dependencies in	express version between 4.0 to 5.0	<pre>1. "dependencies":{"express":"4.x"}</pre>
`package.json`	will be declared as:	Copied!
		1. 1
	Creates an express	2. 2
new express()	object which acts as a server	<pre>1. const express = require("express");</pre>
	application.	<pre>2. const app = new express();</pre>
		Copied!
	The listen method is invoked on the	1. 1 2. 2
	express object with	3. 3
	the port number on	4. 4
express.listen()	which the server listens. The	<pre>1. app.listen(3333, () => { 2. console.log("Listening at</pre>
	function is	<pre>3. http://localhost:3333)</pre>
	executed when the server starts	4. })
	listening.	Copied!
	This method is	
	meant to serve the retrieve requests to	1. 1
	the server. The	2. 2 3. 3
	get() method is to	4. 4 5. 5
	be implemented with two	6. 6
express.get();	parameters; the	1. // handles GET queries to end point /user/about/id.
expressiget(),	first parameter defining the end-	 app.get("user/about/:id", (req,res)=>{ res.send("Response about user "
	point and the	4. +req.params.id)5.
	second parameter	
	is a function taking the request-handler	6. })
	and response-	Copied!
	handler.	
	This method is meant to serve the	
	create requests to	1. 1
	the server. The	2. 2
	post() method is to be implemented	3. 3 4. 4
	with two	5. 5
express.post();	parameters: the first parameter	 // handles POST queries to the same end point. app.post("user/about/:id", (req,res)=>{
	defines the end-	res.send("Response about user"
	point and the second parameter	<pre>4. +req.params.id) 5. })</pre>
	is a function taking	Copied!
	the request-handler	Соріва
	and response- handler.	
express.use()	This method takes	1. 1
•	middleware as a	2. 2 3. 3
	parameter. Middleware acts as	4. 4
	a gatekeeper in the	5. 5 6. 6
	same order that it is used, before the	7. 7 8. 8
	request reaches the	9. 9
	get() and post()	10. 10
	handlers. The order in which the	<pre>1. const express = require("express"); 2. const app = new express();</pre>
	middleware is	<pre>3. function myLogger(req, res, next){ 4 req timeReceived = Date():</pre>
	chained depends on	5. next();
	the order in which the .use() method is	<pre>6. } 7. app.get("/", (req, res)=>{</pre>
	used to bind them.	8. res.send("Request received at

about:blank 1/3

12/13/23, 2:37 PM about:blank

```
"+req.timeReceived+" is a success!")
                        The middleware
                                              10. })
                        myLogger()
                        function takes three
                                             Copied!
                        parameters, which
                       are request,
                        response, and next.
                        You can define a
                        method that takes
                        these three
                       parameters and
                        then bind it with
                        express.use() or
                        router.use(). Here,
                       you are creating
                        middleware named
                        myLogger and
                       making the
                        application use it.
                        The output
                        rendered includes
                       the time the request
                        is received.
                        Router-level
                        middleware is not
                        bound to the
                        application.
                        Instead, it is bound
                        to an instance
                        of express.Router().
                                              10. 10
                        You can use
                        specific
                                              12. 12
                        middleware for a
                                              13. 13
                        specific route
                                              14. 14
                                              15. 15
                        instead of having
                                              16. 16
                        all requests going
                        through the same
                                               1. const express = require("express");
express.Router()
                        middleware. Here,
                                               2. const app = new express();
                                               3. let userRouter = expess.Router();
4. let itemRouter = express.Router();
                        the route is /user
                        and you want the
                                               5. userRouter.use(function (req, res, next){6. console.log("User quert time:", Date());
                        request to go
                        through the user
                       router. Define the
                        router, define the
                                               9. userRouter.get("/:id", function (req, res,
                                              10.
                                                    next) {
                        middleware
                                                    res.send("User "+req.params.id+ " last successful login "+Date())
                                              11.
                        function that the
                                              12.
                        router will use and
                                              13. })
                        what happens next,
                                              14. app.listen(3333, () => {
                        and then you bind
                                              15.
                                                     console.log("Listening at http://localhost:3333)
                        the application
                       route to the router.
                                             Copied!
                        This is an example
                        of static
                        middleware that is
                        used to render
                       static HTML pages
                        and the images
                        from the server
                        side. At the
                       application level,
                        the static files can
                                               1. const express = require("express");
express.static()
                        be rendered from
                                               2. const app = new express();
                        the
                                               3. app.use(express.static("cad220_staticfiles"))
                                               4. app.listen(3333, () => {
                       cad220 staticfiles
                                                     console.log("Listening at http://localhost:3333")
                        directory. Notice
                                               6. })
                        that the URL has
                        only the server
                                            Copied!
